

I am proposing a solution related to farms management of our country, according to data of 2011 census, 68.84% of Indians live in the village & 61.5% of 1300 million India population is rural dependent and dependent on agriculture. Also due to COVID many workers migrated to villages. If we truly concern about increasing GDP etc., we can be done using commercialised our farms and let the farmers manage the field's production directly communicate using this technology to markets. Through that, we can evenly distribute our field production to the whole of the country and can double the income of farmers. If we can manage our production in a proper way it's easier to reduce the cost of the basic requirement of our life i.e. surely can be done by & 70% by field production, not from any multinational production industries.
